"Cells are the fundamental building blocks of life on this planet. Despite

their tiny size, they are wonders of intricacy. Moment by moment, the cells of our bodies are engaged in a dazzling reper-toire of biochemical events, including signaling processes, transmission of genetic information, and delicately choreographed movements. Understanding the basic functions of cells also gives us in-sight when something goes wrong, like in the case of a disease, or when the cell is hijacked, like in the case of a viral infection. Helping our students to appreciate the complexities of this amazing cellular world lies at the heart of our goals as authors of Becker's *The World of the Cell*--

Authoritative, thorough, and engaging, *Life: The Science of Biology* achieves

an optimal balance of scholarship and teachability, never losing sight of either the science or the student. The first introductory text to present biological concepts through the research that revealed them, *Life* covers the full range of topics with an integrated experimental focus that flows naturally from the narrative. This approach helps to bring the drama of classic and cutting-edge research to the classroom - but always in the context of reinforcing core ideas and the innovative scientific thinking behind them. Students will experience biology not just as a litany of facts or a highlight reel of experiments, but as a rich, coherent discipline.

a series of laboratory exercises demonstrating the in-depth experience and understanding of selected methods, techniques, and instrumentation used in biotechnology. This manual is an outgrowth of an introductory laboratory course for senior undergraduate and first year graduate students in the biological sciences at The University of Tennessee. This book is composed of 19 chapters and begins with some introductory notes on record keeping and safety rules. The first exercises include pH measurement, the use of micropipettors and spectrophotometers, the concept of aseptic technique, and preparation of culture media. The subsequent exercises involve the application of the growth curve, the isolation, purification, and concentration of

plasmid DNA from *Escherichia coli*, and the process of agarose gel electrophoresis. Other exercises include the preparation, purification, and hybridization of probe, the transformation of *Saccharomyces cerevisiae*, the transformation of *E. coli* by plasmid DNA, and the principles and applications of protein assays. The final exercises explore the β -galactosidase assay and the purification and determination of β -galactosidase in permeabilized yeast cells. This book is of great value to undergraduate biotechnology and molecular biology students.
