The proposed multiresolution fractal coders are image compression schemes that combine wavelet and fractal transforms. They improve the performance of conventional fractal compression algorithms. They reduce the characteristic distortions of fractal algorithms: blocking artifacts and image blurring, by a better coding of high frequencies. 1 Introduction

Now, using novel fractal- and wavelet-based methods, developers are abandoning the JPEG standard for higher 20:1 to 50:1 compression ratios. Fractal and wavelet algorithms offer significant side benefits beyond high compression ratios. One feature, progressive image transformation, cuts decompression times for lower-resolution image rendering.

At common compression ratios, up to about 50:1, Fractal compression provides similar results to DCT-based algorithms such as JPEG. At high compression ratios fractal compression may offer superior quality. For satellite imagery, ratios of over 170:1 have been achieved with acceptable results. Fractal video compression ratios of 25:1–244:1 have been achieved in reasonable compression times (2.4 to 66 sec/frame).

Given these limitations of wavelet-based fractal coding algorithms, we propose a new algorithm of wavelet fractal image compression to take effective advantage of the fine properties of wavelet coefficients corresponding to wavelet transform. 4 Adaptive Wavelet Fractal Coding with Four-Fork Tree The algorithm we propose is based on the proposition that, when wavelet transform is applied to images, there will be a number of zero coefficients and small coefficients.

Abstract Generally the fractal image compression is a technique based on the presentation of an image by a contractive transform, on the space of image, for which the fixed point is close to the original image. The fractal image compression is rapidly growing principle covers a wide variety of coding scheme in various domains.

Fractal encoding and wavelet transform methods take two different approaches to discovering structure in image data. Barnsley and Sloan (1988,1990) first recognized the potential of applying the theory of iterated function systems to the problem of image compression. They patented their idea in 1990 and 1991.
