Neural Circuit and Cognitive Development: Comprehensive ...

A neural circuit consists of neurons that are interconnected by synapse. Once activated, they carry a specific function. They connect forming a large scale brain network. Neural circuits are both functional and anatomical entities.

Myelin plasticity in circuit function. Neural circuit function requires not only precise connectivity but also regulation of signal timing and metabolic support for axons. Myelination can robustly influence neural circuit dynamics (for review, see Mount and Monje, 2017). The geometric properties of myelinated internodes, including sheath thickness and internode length, contribute to conduction velocity, together with the diameter of the axon itself.

Abstract. Brain-derived neurotrophic factor (BDNF)--a member of a small family of secreted proteins that includes nerve growth factor, neurotrophin 3 and neurotrophin 4--has emerged as a key regulator of neural circuit development and function. The expression, secretion and actions of BDNF are directly controlled by neural activity, and secreted BDNF is capable of mediating many activity-dependent processes in the mammalian brain, including neuronal differentiation and growth, synapse ...

Neurotrophin regulation of neural circuit development and ...

The development of neural circuits is a complex process that relies on the proper navigation of axons through their environment to their appropriate targets. While axon-environment and axon-target interactions have long been known as essential for circuit formation, communication between axons themselves has only more recently emerged as another crucial mechanism.

Emerging roles of astrocytes in neural circuit development. Astrocytes are now emerging as key participants in many aspects of brain development, function and disease. In particular, new evidence shows that astrocytes powerfully control the formation, maturation, function and elimination of synapses through various secreted and contact-mediated signals.

Abstract. Subplate neurons indispensably orchestrate the developmental assembly of cortical neural circuits. Here, by cell type-specific dissection of Aridia function, we uncover an unexpectedly selective role for this ubiquitous chromatin remodeler in subplate neuron molecular identity and circuit wiring function. We find that pan-cortical deletion of Aridia, but not sparse deletion, leads to ...

The genetic, molecular, and cellular mechanisms of neural development are essential for understanding evolution and disorders of neural systems. Recent advances in genetic, molecular, and cell biological methods have generated a massive increase in new information, but there is a paucity of comprehensive and up-to-

date syntheses, references, and historical perspectives on this important subject. The Comprehensive Developmental Neuroscience series is designed to fill this gap, offering the most thorough coverage of this field on the market today and addressing all aspects of how the nervous system and its components develop. Particular attention is paid to the effects of abnormal development and on new psychiatric/neurological treatments being developed based on our increased understanding of developmental mechanisms. Each volume in the series consists of review style articles that average 15-20pp and feature numerous illustrations and full references. Volume 3 offers 40 high level articles devoted mainly to anatomical and functional development of neural circuits and neural systems, as well as those that address neurodevelopmental disorders in humans and experimental organisms. Series offers 144 articles for 2904 full color pages addressing ways in which the nervous system and its components develop Features leading experts in various subfields as Section Editors and article Authors All articles peer reviewed by Section Editors to ensure accuracy, thoroughness, and scholarship Volume 3 sections include coverage of: mechanisms that control the assembly of neural circuits in specific regions of the nervous system, multiple aspects of cognitive development, and disorders of the nervous system arising through defects in neural development
