plant life cycle sstage that begins when cells in reproductive organs undergo meiosis and produce haploid cells. sporophyte. plant life cycle stage that begins when an egg is fertilized by a sperm. frond. leaf of a fern that grows from the rhizone. rhizone. underground stem of a fern. sori.

Section 4 – Introduction to Plant Reproduction Flashcards ...
When the game- tophyte matures, it produces female egg cells or male sperm cells (about half of all mosses can produce both on the same plant). The sperm cells are released (that ' s not what you see in the picture.) If the sperm unites with an egg, it forms a zygote, thus beginning the second phase of its life cycle.

Chapter Resources: Plant Reproduction
An angiosperm is a plant that produces seeds within a fruit. Reproduction begins when the pollen from the anther is in contact with the stigma. Eventually the egg will be fertilized in the ovule that is in the ovary and turn from a zygote to an embryo inside the seed. The life cycle of angiosperms among the different species is very similar: Pollination, fertilization, and the development of fruit.

A plants life cycle starts with a seed. When it receives the right amount of sunlight, water, and air, it will begin to grow. The Seed sprouts, then grows into roots, a stem, then develops leaves, flowers and more seeds. The sprouted seed which grows down into the soil is called root.

Reproduction in Plants and Animals | Free Homework Help
There are a variety of ways plants can reproduce asexually, or without a partner. For example, some nonflowering plants, such as moss and algae, reproduce by spore formation. Spores grow on a plant, then break off and grow into separate organisms. Other plants, such as strawberries, are able to reproduce asexually through vegetative propagation.
